PLD

Last modified: Monday, April 14, 2003

Short for *programmable logic device*, a generic term for an integrated circuit that can be programmed in a laboratory to perform complex functions. A PLD consists of arrays of AND and OR gates. A system designer implements a logic design with a device programmer that blows fuses on the PLD to control gate operation.

System designers can use development software that converts basic code into instructions a device programmer needs to implement a design.

PLD types can be classified into the following groups

- **PROMs (Programmable Read Only Memory)** - offer high speed and low cost for relatively small designs
- **PLAs (Programmable Logic Array)** - offer flexible features for more complex designs
- **PAL/GALs (Programmable Array Logic/Generic Array Logic)** - offer good flexibility and are faster and less expensive than PLAs
